EDUCATION

University of California, San Diego

Bachelor of Science in Data Science, 4.0 GPA

La Jolla, CA

Sep. 2025 – Jun. 2029

EXPERIENCE

IEEE @ UCSD

Quarterly Projects Member

Oct. 2025 – Dec. 2025

- Augmented and displayed samples of astronomical CCD images, then trained CNN to detect and map stars

Quantum Materials Research

Research Intern

July 2024 – September 2024

- Researched ideal solar panel materials (alternatives to Silicon) in the Quantum Materials Research Group under Prof. Singh of URochester
- Utilized Python and the Materials Project Database API to filter through 300,000 materials to find potential replacements, and presented findings in a research seminar to 10+ material scientists

Aspiring Scholars Directed Research Program

Researcher

Jan. 2024 – Aug. 2024

- Conducted research surrounding the Navier-Stokes equations and planned to optimize airplane wing aerodynamics utilizing a PINN

PROJECTS

c0mpiled-5: Future Interfaces Hackathon

Developer

Feb. 2026

- Built NIGEL, a real-time “mission control” dashboard that fuses VSLAM point clouds and radio audio transcripts into an interactive 3D tactical floor plan for indoor incident coordination.
- Engineered a multi-unit dispatcher UI (React + Three.js) supporting up to 6 simultaneous feeds, with focus/expand interactions, and semantic radio parsing

Sand Hacks

Developer

Feb. 2026

- Built a full-stack spatial memory system that persists object locations over time using ROS2, RTAB-Map VSLAM, YOLO, and custom depth fusion
- Implemented real-time 3D visualization with Three.js, rendering live point clouds and object confidence data streamed via ROS WebSockets
- Designed a voice-first interface enabling queries with speech recognition, TTS, and low-latency LLM responses

SDX Vercel Hackathon

Backend Developer

Jan. 2026

- Developed a fully traceable results system linking every simulated trade back to its originating prompt change
- Implemented live plan regeneration, allowing UI-level edits (sliders, toggles) to update backend specs, allowing users to view trades on Kalshi and Polymarket, fitting their prompt

SDX HelixDB Hackathon

ML Backend Developer

Nov. 2025

- Utilized RAG principles to make a full stack application to connect professors with students based on research interests and publications
- Built backend using FastAPI and Hugging Face sentence transformers, semantically scoring data from webscraped UCSD professor directory and beautifying results using Claude API

AWARDS & SKILLS

Awards: Gold Presidential Volunteer Service Award (250+ hours, Dublin High Chess Club), Empower Hacks 2.0 Winner (8th/1900 submissions) for developing a Scholarship Probability Model, Placed 3rd in the 1st annual Dublin Hackathon, Received the IASC AstroGen Certificate for finding unidentified asteroids for a NASA Database

Software: Python, Java, JavaScript, HTML/CSS, NumPy, Matplotlib, TensorFlow, PyTorch, Scikit-learn, Pandas, MongoDB, MySQL, Android Studio
