EDUCATION

University of California San Diego

Mar 2027

Bachelor of Science in Data Science

GPA: 4.0 / 4.0

- **Coursework:** Machine Learning, Recommender Systems, LLM, Comp Vision, Data Management & Visualization

EXPERIENCE

AI Engineer Intern

Sep 2025 - Present

Cadre AI

San Diego, California

- Cleaned and normalized **16M** eMolecules search queries into unified chemical names and built a dashboard on **5K** best-selling molecules, **6K** targetable customers, and site usage to support R&D, inventory and outreach planning.
- Automated cross-platform marketing performance reporting by developing a workflow that integrates email and LinkedIn data, standardizes metrics, and emails weekly KPI summaries, reducing data collection time by **80%**.
- Built a webhook-triggered pipeline that ingests Fireflies transcripts, classifies clients via Airtable records, creates meeting folders with generated reports and sends summaries on Slack channels, removing manual documentation.
- Identified **10+** key pre-purchase behavioral and marketing drivers of conversion by linking inquiry events to transactions, engineering person-level features, applying logistic regression inference, and building a Streamlit dashboard with a conversion probability calculator.

National Security Machine Learning Intern

Sep 2025 - Dec 2025

United States Department of Defense

San Diego, California

- Built an assurance app for NIWC Pacific using React and Flask to evaluate safety and reliability of image classifiers by testing on in-distribution, out-of-distribution, and adversarial datasets generated via random noise algorithms.
- Developed ratio-based metrics comparing model evaluation scores (e.g., accuracy, F1, recall) across data distributions to quantify performance shifts, set safety thresholds, and report environment-specific reliability.

Machine Learning Engineer

Aug 2025 - Present

UC San Diego Division I Men's Basketball

San Diego, California

- Building a deep learning computer vision pipeline for automated play classification to enhance real-time scouting.
- Used SigLIP embeddings of cropped player detections and k-means clustering to assign team labels (home, away).
- Annotated court keypoints from **1k+** frames in Roboflow, finetuning YOLO models for live detection.

Data Science Intern

Jun 2025 – Aug 2025

Najm for Insurance Services

Riyadh, Saudi Arabia

- Identified **30+** high-risk car accident zones by creating geospatial heat maps with DBSCAN, shaping safety plans.
- Engineered **15+** features via Google Maps API and geospatial joins (e.g., mall counts), temporal signals (holidays, school breaks), lag counts, population density, weather API, and derived risk zones, improving accident forecasts.
- Built an automated pipeline with Apache Airflow to generate weekly zone-level accident predictions using XGBRegressor with cumulative learning, cutting error rate by **20%** and reducing surveyor dispatch time by **30%**.

PROJECTS

PlotCraft | *Pytorch, HuggingFace, Gradio*

Apr 2025

- Created a web app that generates movie titles and plots from user-provided genres, keywords, and creativity level.
- Designed and tokenized custom input-output prompts from over **200,000** movies in The Movie Database.
- Fine-tuned Google's T5 model on the data, optimizing learning rate and weight decay to minimize validation loss.
- Improved text-generation quality by adjusting temperature and top-k, balancing creativity and coherence.

OutageAI: Predicting & Explaining Power Outage Impact | *Scikit-learn, Plotly, Pandas*

Mar 2025

- Engineered the impact metric using Principal Component Analysis with outage duration and customers affected.
- Identified key indicators of impactful power outages through permutation testing and interactive visualizations.
- Trained a Random Forest Regressor model to predict power outage impact, tuning hyperparameters using Grid Search to maximize model performance, reducing error rate by **9.6%** over the baseline model.

TECHNICAL SKILLS

Languages: Python, Java, SQL, JavaScript, HTML, CSS, MATLAB, LaTeX

Tools: Git, Docker, AWS, Vercel, Supabase, PostgreSQL, Microsoft SQL Server, Spark, Roboflow, Tableau, Excel

Libraries & Frameworks: NumPy, Pandas, GeoPandas, Matplotlib, Plotly, Scikit-learn, PyTorch, Statsmodels, OpenCV, BeautifulSoup, D3.js, React, Tailwind, Flask, FastAPI
