Education

University of California, San Diego, Data Science B.S.

Fall 2023 - Spring 2027
(estimated)

- GPA: 3.9/4.0
- Relevant coursework: DSC 20 (Object oriented programming, Python) DSC 30 (Data Structures and Algorithms, Java), DSC 100 (Postgres SQL), DSC 106 (Data visualization), DSC 256 (Recommender Systems), MATH 183 (Statistical Methods)

Experience

Data Science Tutor for DSC 10 - Principles of Data Science, UC San Diego, CA

September 2024 – December 2024

- Held Office Hours and Group Sessions to help students apply lecture material into assignments. Answered questions on the class forum (EdStem).
- Topics included numpy, Pandas, Matplotlib, regression, hypothesis testing, regression.
- Personally reached out to students who were struggling via email to schedule group sessions with them.
- Reviewed assignments for any errors before they were posted on the class website including issues like unclear explanations.
- Graded assignments, quizzes and exams. Updated class website with solutions after grades were released for future review.

Infodart intern

July 2024 - September 2024

- Built data models for classifying emails into six categories, which was then used to automate ticket generation, improving response times.
- Analyzed ~10,000 past emails pulled from the customer service Gmail account and used NLTK (NLP - Natural Language Processing) sentiment analysis for classification.

Projects

DS3 Group Projects: [Geisel IOT Logger](#)

September 2025 - December 2025

- Using the bluetooth capabilities of ESP32 boards, counted the number of people on individual floors of the Geisel Library.
- Signals are filtered by strength to avoid over-counting of devices or devices from other floors. Each device's MAC address is hashed for privacy.
- Arduino used C++ and embedded systems knowledge. Dashboard used React.js and was hosted using Vercel. Worked on back end with Firebase. Learned product design overall.

DSC 106: [A Peek Into Vegetation Health and Climate Change](#)

September 2025 - December 2025

- Explored the trends of vegetation in the USA 2000-2025 to create an interactive visualization of the vegetation coverage in the USA. Data was from NASA MODIS API (XML, .xml) Vegetation Layers. The visualization included an interactive choropleth map and some other line charts. Data transformation was required to create an interactive visualization, compressing number of points too large to operational without losing quality.
- The goal of the visualization was to explore climate change pattern data analytics, since vegetation is much more sensitive to environmental factors, emphasizing data storytelling.

IEEE Quarterly Group Projects: [Speech Analyzer](#)

April 2024 - June 2024

- Used a Raspberry Pi Zero and an LCD screen connected via breadboard to display the result.
- First, converted speech to text. Using a machine learning model we trained using PyTorch, analyzed the text to display whether it had a positive sentiment or a negative one along with a percentage.

Clubs and Leadership

Data Science Student Society (DS3): Project mentor

December 2025 - Present

- Project works with review data from 50 states, each state having 1 million+ reviews. End goal is to help businesses find optimal locations to open new branches. Teaching new data science students to work with big data.
- Covered the Data Science project life cycle: Question, EDA, refining question, data cleaning, modeling, deployment. Taught git version control and Github collaboration.
