WORK EXPERIENCE

Software Developer | Company June 2024 – January 2026

- Pioneered the organization’s first member-facing AI search tool for 1M+ users, integrating a Retrieval-Augmented Generator (RAG) and Azure AI Search to deliver dynamic, context-aware results significantly better than legacy keyword matching.
- Engineered a high-performance predictive autocomplete system on Azure ARO achieving sub-50ms latency, streamlining navigation for 500K+ internal users by designing a custom React/Vite UI backed by optimized Azure indices.
- Orchestrated a zero-downtime production rollout to millions of members using LaunchDarkly feature flags, enabling precise traffic control and risk-free testing of new Python/Azure backend services.
- Optimized CI/CD pipelines by pruning unused dependencies, reducing build latency from 10 to 4 minutes and boosting overall team productivity by 10%.
- Enabled data-driven product iterations by partnering with Adobe Analytics to instrument frontend telemetry, expanding coverage to the Experience API to capture high-fidelity query metrics and user behaviors in ELK.

Software Developer Intern | Company June 2023 – August 2023

- Engineered the native iOS "Add Project" workflow for the project cost management system, translating wireframes into complex Swift/Objective-C interfaces that allow managers to generate instant project cost estimates.
- Developed an interactive Financial Dashboard for executive management, implementing third-party charting libraries and REST APIs to visualize real-time net cash flow and fiscal data.
- Delivered 20+ production pull requests in 10 weeks, implementing core features for the 30,000-user internal employee app ahead of schedule while ensuring 100% test coverage.

PROJECTS

Personal Project Name | Full-Stack Web App & Browser Extension April 2025 – Present

- Engineered a schema-driven extraction engine that parses JSON-LD and Schema.org metadata, reducing raw HTML payloads by 95% while achieving high-accuracy parsing across major recipe domains.
- Built a centralized "Recipe Wiki" platform (React/Vite) that indexes 100+ recipes, optimizing Core Web Vitals to ensure zero layout shift and sub-50ms search latency.
- Developed a custom browser extension to perform real-time DOM manipulation, stripping ads and tracking scripts to deliver a sub-100ms reading experience.

Clinical Management System | Engineering Service Learning Project January 2022 – May 2022

- Engineered a secure patient-tracking dashboard (React/Node.js) with Role-Based Access Control (RBAC), enabling 20+ hospital staff to safely manage sensitive medical records.
- Digitized manual clinical workflows, replacing paper logs with real-time status updates that reduced communication delays between staff and families by ~30%.
- Collaborated across a 4-person agile team to integrate frontend and backend services, establishing clear data structures that streamlined development and ensured on-time delivery.

EDUCATION

- The University May 2024
Bachelor of Science in Software Engineering | Minor in Biology

TECHNICAL SKILLS

- Languages & Frameworks: Python, Java, TypeScript, JavaScript, Swift, SQL, React, Node.js, Vite, Pandas
- Cloud & AI: Azure (AI Search, ARO), AWS, RAG (Retrieval-Augmented Generation), Docker, Kubernetes
- DevOps & Tools: GitHub Actions, Jenkins, LaunchDarkly, Gradle, Git, REST APIs, Adobe Analytics, JIRA
