EDUCATION

Master of Science in Computer Science
Arizona State University

August 2024 - May 2026
GPA: 3.9/4

Bachelor of Engineering in Electronics
BITS Pilani

August 2017 - May 2022
GPA: 7.8/10

SKILLS

REST API Development: Java Spring Boot, Spring Data JPA
Database: AWS DynamoDB, PostgreSQL, Redis
CI/CD: Docker, Kubernetes, GitHub Actions, ArgoCD, AWS EKS

Testing: JUnit, Mockito
Messaging: Kafka
Monitoring: Splunk, Datadog

WORK EXPERIENCE

Software Engineer 2
Samsung Research

March 2024 - August 2024
Suwon, South Korea

- Built a Kafka connector ETL data pipeline to migrate 1 billion records from PostgreSQL to DynamoDB and upgraded the legacy Samsung Account User Profile microservice to achieve a 80% faster API response.
- Supported live writes during the Kafka topic to DB migration to ensure data consistency and zero downtime in production, and used Spring AOP to resolve DB queries for overlapping live and migrated data.
- Analyzed Mybatis SQL queries in the legacy application and converted them to DynamoDB mapper queries in the repository layer for the new Spring Boot APIs, and performed canary deployments for easy rollback.
- Acted as Agile scrum master for 3 interns, assigned them story points on Jira and reviewed pull requests.

Software Engineer 1
Samsung Research

July 2022 - February 2024
Bangalore, India

- Reduced Redis memory usage in Samsung Account Authentication microservice by 65% in each cluster, saving \$2.3 million in AWS ElastiCache costs by monitoring Datadog for low traffic APIs, removing some Redis keys and maintaining them as Global Secondary Indexes in DynamoDB.
- Improved fault tolerance of OAuth2 access tokens by utilizing hybrid DynamoDB and Redis storage to eliminate single points of failure and enhance service availability.
- Made device blocking logic in Samsung Account Fraud Detection microservice code-independent using Rule Management System, reducing deployment time from 4 hours to 30 seconds.
- Used Rule Engine to implement device blocking based on password failures, ID change frequency, IMEI validation, etc. such that any new logic could be implemented without code changes or re-deployment, using Redis pub-sub to update Rule Engine across Kubernetes pods of different AWS regions.

Software Engineering Intern
Juniper Networks

July 2021 - December 2021
Remote

- Created a dashboard using React.js for customer support team to check product catalog and order history using filters based on country code and date range, with selective view functionality based on authorization.
- Expanded unit test case coverage and performed regression testing in staging to ensure stable releases.

ACADEMIC PROJECTS

1. Developed an event-driven architecture with Kafka to process real-time data streams and perform graph based data analytics using Neo4j DB, and deployed it on Kubernetes for Docker container orchestration. [\[Link\]](#)
2. Deployed a face recognition model on a distributed cloud system using AWS EC2, Python Flask and Boto3, and implemented a custom autoscaling algorithm for backend instances based on AWS SQS queue size. [\[Link\]](#)
