EDUCATION

University of California, San Diego

B.S., Data Science

San Diego, CA

Expected June 2028

- **Relevant Coursework:** Data Structures and Object-Oriented Design, Theoretical Foundations of Data Science, Linear Algebra, Introduction to Artificial Intelligence, Machine Learning, Practice and Application of Data Science

PROJECTS

Churn Predictor — ML-Powered Customer Churn Web App

React (Vite + TS), FastAPI, PostgreSQL, scikit-learn, Docker, JWT

- Built an end-to-end churn prediction system where users upload customer CSVs and receive real-time ML predictions from a FastAPI-based inference service.
- Trained and evaluated a scikit-learn RandomForest model with feature preprocessing and validation to improve churn prediction reliability.
- Containerized the web client, API, and ML service with Docker and secured access using JWT auth with bcrypt and protected routes.

BrokerBot — LLM-Powered Negotiation Agent

Next.js, Node.js/Express, PostgreSQL, Cheerio + Axios, SerpAPI, Twilio — Team

- Designed an LLM-powered broker agent using a custom Claude wrapper to autonomously negotiate pricing with contractors, showcasing agentic AI behavior at SDx Hackathon.
- Integrated SerpAPI with Cheerio/Axios to scrape and structure contractor contact data, persisting results in PostgreSQL for downstream use.
- Automated SMS outreach and negotiation flows via Twilio, enabling iterative quote collection and comparison through a fully scripted pipeline.

Image and Audio Processing Application

Python, Streamlit, OOP, KNN

- Developed a Python/Streamlit application for interactive image and audio manipulation, supporting real-time experimentation with multimodal data.
- Implemented image operations (brightness, pixelation, edge detection, rotation) and audio transforms (reverse, speed/slow, reverb, clipping) using discrete signal processing.
- Applied OOP design with reusable class hierarchies and a simple KNN module to reinforce core ML and software engineering concepts.

Do Know Harm — Game Development

C++, Unity, OOP, Playtesting/QA — Team

- Built features for a medically accurate RPG with a UCLA student team.
- Used C++ and Unity with OOP to implement and refine gameplay objects.
- Executed test passes and debugging to identify, prioritize, and resolve defects.

TECHNICAL SKILLS

Programming Languages: TypeScript, JavaScript, Python, C++, SQL, HTML/CSS

Tools/Technologies: React, Node.js, Express, Vite, Streamlit, PostgreSQL, Prisma, REST APIs, JWT, bcrypt, Git/GitHub, CORS, FastAPI, scikit-learn, pandas, Docker, uvicorn, Cheerio + Axios, SerpAPI

Concepts: Machine Learning, Object-Oriented Programming, Data Structures, Algorithms, Authentication, Containerization, Debugging
