EDUCATION

T40 CS	Expected 2027
Bachelor of Science, Computer Science	
City, ST	
• Relevant Courses: Data Structures & Algorithms, Computer Organization I & II, Combinatorics & Graph Theory	

EXPERIENCE

Part-Time Software Developer (Content Production) No-name company	Sep 2025 – Present
• Delivered functional telecom hardware emulations, measured by support coverage for 1,000+ global scenarios, by converting product requirements into functional emulations using a proprietary XML framework.	
• Eliminated dependency on physical devices for support teams, achieving 100% behavior parity by implementing deterministic, state-based decision logic.	

Software Engineering Intern No-name company	Jun 2022 – Aug 2022
• Accelerated feature delivery, measured by a 30% reduction in development time, by consolidating separate iOS and Android codebases into a single cross-platform Flutter application.	
• Built reliable inventory and transaction systems deployed for multiple small-to-medium business clients, by developing end-to-end CRUD workflows backed by Firebase Realtime Database.	
• Improved engineering reliability through continuous automated testing, by building CI/CD workflows in GitHub Actions with parallel Linux and macOS runners.	

PROJECTS

NLP Narrative Visualizer | *Python, Docker, MLX/PyTorch, SQLite, Matplotlib*

- Engineered a cross-platform narrative analysis engine, ensuring high-performance inference for the end user, by building a custom runtime abstraction layer that dynamically executes local LLMs on ARM (Apple Silicon) and x86_64 architectures.
- Enabled large AI models to run on consumer hardware, measured by a 75% reduction in memory usage (16GB to 4GB), by applying 4-bit and double-quantization techniques.
- Extracted character sentiment and narrative impact from 100+ story events across 60+ chapters, by applying context-aware sentiment modeling and visualizing cumulative character impact over time.
- Ensured reproducible deployments, measured by consistent local and cloud execution, by containerizing the pipeline with Docker and managing versioned images through AWS ECR.

Persona Fusion Engine | *Java, Spring Boot, JSON, PostgreSQL, Next.js*

- Built a full-stack persona fusion calculator, measured by support for 252 deterministic combinations, by implementing an optimized fusion algorithm with constant-time in-memory lookups.
- Reduced database query complexity, enabling efficient access across an 840+ persona dataset, by designing a normalized PostgreSQL schema with indexed fields and optimized JPA query methods.
- Improved frontend responsiveness during real-time filtering of 160+ image assets, eliminating race conditions by implementing memoized state management and async request cancellation in Next.js.

Automated Schedule Porter | *Python, Selenium, Google Cloud Platform*

- Eliminated 100% of manual data entry by engineering a Selenium-based scraper to extract schedules from secure employee portals and upload them to personal calendar.
- Reduced scheduling time from minutes to seconds, measured by an 18-second end-to-end execution, by integrating the Google Calendar API with OAuth-enabled batch event creation on GCP.

SKILLS

Languages: Java, Python, JavaScript, Dart
Frameworks/Libraries: Spring Boot, React, Flutter, Next.js, Tailwind CSS, shadcn/ui
Infrastructure & Data: Git, AWS ECR/ECS, Docker, PostgreSQL
Familiar With: TypeScript, C, Swift, Kotlin, Selenium, Jira (Agile)
