

EDUCATION

University of California, Berkeley

Berkeley, CA

B.S. Electrical Engineering & Computer Sciences (EECS)

Expected May 2026

Relevant Coursework: Data Structures & Algorithms, Operating Systems, Computer Architecture, Distributed Systems, Computer Security, Signals & Systems

EXPERIENCE

Software Engineering Intern

Nov. 2025 – Present

San Francisco, CA

- Implemented initial AWS infrastructure for a zero-to-one social discovery product, including IAM (RBAC, MFA), billing controls, and secure environment foundations
- Provisioned and secured Amazon RDS PostgreSQL to support persistent storage for users, events, and location-based queries as the product scales
- Designed backend data models and access patterns to enable real-time, map-based event discovery and fast querying of nearby events

Software Engineering Intern

Feb. 2025 – June 2025

San Francisco, CA

- Built and productionized Python data ingestion pipelines for high-throughput esports feeds (live odds, match results, player stats) across 5+ game titles, supporting real-time downstream analytics
- Integrated and reverse-engineered undocumented REST and WebSocket APIs, implementing schema validation, retries, and fallback logic to reduce ingestion failures by ~40%
- Designed fault-tolerant, idempotent processing workflows to handle rapid odds updates, match state transitions, and edge-case market structures
- Deployed and optimized AWS Lambda pipelines for bursty tournament traffic, improving system reliability and scalability under peak load
- Implemented market-name normalization and bookmaker-to-internal schema mappings, enabling consistent downstream analytics across heterogeneous data sources

PROJECTS

Flash Loan Liquidation Engine | Solidity

2025

- Designed and implemented a Solidity smart contract leveraging Uniswap V2 flash loans to atomically liquidate undercollateralized Aave positions
- Built end-to-end liquidation logic covering debt repayment, collateral seizure, asset swaps, and fee-aware flash-loan repayment
- Ensured atomicity and correctness under adversarial on-chain execution and MEV-sensitive conditions

High-Performance Image Processing Engine | C, OpenMP, AVX

2024

- Built a parallel image convolution engine using OpenMP and SIMD vectorization (AVX)
- Optimized memory access patterns and cache utilization, achieving significant performance improvements over serial implementations
- Partitioned workloads across CPU cores to maximize throughput under compute-bound constraints

Secure File Sharing System | Go

2025

- Developed a secure file-sharing backend supporting authenticated users, encrypted storage, and fine-grained access control
- Implemented cryptographic protocols and custom data structures to enforce confidentiality, integrity, and access revocation under concurrent usage

TECHNICAL SKILLS

Languages: Python, Java, C, C++, SQL, JavaScript, Go, Solidity

Frameworks & Libraries: React, Node.js, OpenMP, Web3.py

Cloud & DevOps: AWS (Lambda, RDS, IAM, CloudWatch), Docker

Databases & APIs: PostgreSQL, REST APIs, WebSocket APIs

Tools: Git, Postman
